# Practical 01 – Create Database and Tables

### **Objectives of this practical**

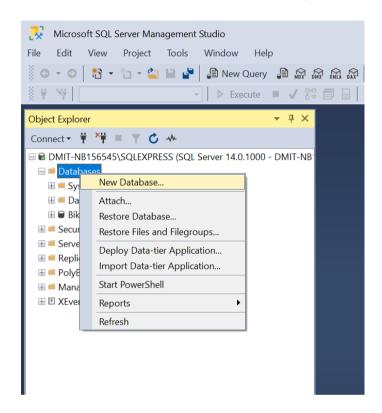

- Create a named database for specific use under a DBMS to store interrelated relations
- Learn the format of creating table with entity integrity
- Understand how to specify general domain constraints for attributes
- Use of Management Studio to help navigate the contents of RDB

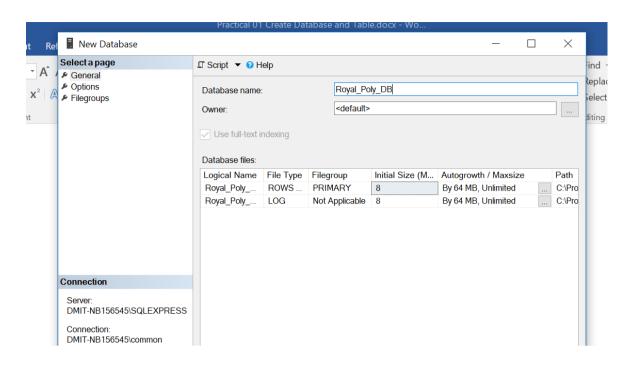

#### **Section A: Create Database**

Use the SQL command to create the Royal Poly database:

Create Database Royal\_Poly\_DB

(Hint: Launch Microsoft SQL Server Management Express Studio, click New Query. Enter the above command and click Execute. You may want to save your file as Create Database.sql.)

#### **Section B: Create Table with Primary Key**

Create all the following relations in the Royal Poly database in MS SQL Server 2005 Express based on the specifications below. It is important that you do so as these are the tables needed for practical 2 onwards.

- (a) Staff Relation
- (b) Course\_Relation
- (c) Department\_Relation

#### Note:

Step 1: What is the Name of the Table?

Rules for Creating Table Name

Must start with a Letter

Contain no spaces

Contain very few special characters

Table name is NOT case sensitive

Cannot use SQL reserved words

Step 2: Define the Constraints for each column

Define Column Name

Constraint 1: Data type

Constraint 2: NULL or Not Null. Default is Null when not specified

As an example, a portion of the create table for Staff\_Relation is shown below. Complete the code and do the same for Course Relation and Department Relation.

Create table Staff\_Relation

(Staff\_No Char(40 Not Null, Staff\_Name Varchar(100) Not Null,

## Section C: How to delete a table?

Drop table < table\_name>
